

MLOps

In-Class Assignment 2

Previously we talked about the problem of delivery delay. Suppose now that the delay is measured as a difference between actual and promised delivery dates. You want to build a model for predicting these delays (whether they happen, not the length of a delay).

Describe as fully as possible

- (1) The data you will want to answer this question
- (2) The kind or kinds of models to use
- (3) Who will be the end users for the model
- (4) And how it will be used
